

## Company Profile

[BUFFERZONE](#) protects organizations from a wide range of threats with patented containment, CDR - bridging and intelligence technologies. Instead of blocking, BUFFERZONE isolates potentially malicious content from web browsers, email, communication apps like WhatsApp, Line, WeChat, [Zoom](#) and removable storage, into a virtual container that keeps the application separate from real memory, registry, files and network resources of the computer

BUFFERZONE maximizes user productivity with seamless, unrestricted access to information and applications, while empowering IT with a simple, lightweight, and cost-effective solution for up to thousands of endpoints within and beyond the corporate network and according to security best practices. Browsing sessions that access external, untrusted content such as unknown internet sites are kept in a virtual container, protecting trusted resources from any potential threats; email message and attachments from untrusted sources are similarly contained. The SafeBridge® technology allows safe extraction from the container using CDR technologies, and advanced code analysis (static and dynamic) for files containing macros and executables.

In the current trend of the COVID-19 around the globe, organization would be required to address WFH challenges, BUFFERZONE [WFH](#) helps the transition and promotes secure remote from home connection to corporate assets.

The BUFFERZONE agent is an advanced endpoint isolation solution for endpoint protection, including automatic containment for Safe Browsing and Safe Mail. Browsing sessions that access external, untrusted content such as unknown internet sites are kept in a virtual container, protecting trusted resources from any potential threats; email message and attachments from untrusted sources are similarly contained.
